

## ADHESIVE AND PERIPHERAL SYSTEMS AND METHODS FOR MEDICAL DEVICES

### CROSS REFERENCE TO RELATED APPLICATIONS

**[0001]** This application is a Continuation Application of U.S. patent application Ser. No. 15/897,577, filed Feb. 15, 2018 and entitled “Adhesive and Peripheral Systems and Methods for Medical Devices”, now U.S. Pat. No. 10,716,893, issued Jul. 21, 2020 (Attorney Docket No. W74), which is a Continuation Application of U.S. patent application Ser. No. 13/975,770, filed Aug. 26, 2013 and entitled “Adhesive and Peripheral Systems and Methods for Medical Devices”, now U.S. Pat. No. 9,895,499, issued Feb. 20, 2018 (Attorney Docket No. L07), which is a Continuation Application of U.S. patent application Ser. No. 12/395,215, filed Feb. 27, 2009 and entitled “Adhesive and Peripheral Systems and Methods for Medical Devices”, now U.S. Pat. No. 8,518,000, issued Aug. 27, 2013 (Attorney Docket No. H12), which is a Continuation Application of U.S. patent application Ser. No. 11/704,897, filed on Feb. 9, 2007 and entitled “Adhesive and Peripheral Systems and Methods for Medical Devices” now issued U.S. Pat. No. 8,113,244, issued Feb. 14, 2012 (Attorney Docket Number 1062/E73), which claims priority from U.S. Provisional Patent Application Ser. No. 60/772,313, filed Feb. 9, 2006 and entitled “Portable Injection System” (Attorney Docket No. 1062/E42); U.S. Provisional Patent Application Ser. No. 60/789,243, filed Apr. 5, 2006 and entitled “Method of Volume Measurement for Flow Control” (Attorney Docket No. 1062/E53); and U.S. Provisional Patent Application Ser. No. 60/793,188, filed Apr. 19, 2006 and entitled “Portable Injection and Adhesive System” (Attorney Docket No. 1062/E46), each of which is hereby incorporated herein by reference in its entirety.

**[0002]** U.S. patent application Ser. No. 11/704,897 may also be related to one or more of the following U.S. patent applications, all of which are hereby incorporated herein by reference in their entireties:

**[0003]** U.S. patent application Ser. No. 11/704,899, filed on Feb. 9, 2007 and entitled “Fluid Delivery Systems and Methods”, now U.S. Pat. No. 8,414,522, issued Apr. 9, 2013 (Attorney Docket No. 1062/E70);

**[0004]** U.S. patent application Ser. No. 11/704,896, filed on Feb. 9, 2007 and entitled “Pumping Fluid Delivery Systems and Methods Using Force Application Assembly”, now U.S. Publication Number US 2007/0219496, published on Sep. 20, 2007 (Attorney Docket No. 1062/E71);

**[0005]** U.S. patent application Ser. No. 11/704,886, filed on Feb. 9, 2007 and entitled “Patch-Sized Fluid Delivery Systems and Methods”, now U.S. Pat. No. 8,439,875, issued May 14, 2013 (Attorney Docket No. 1062/E72); and

**[0006]** U.S. Provisional Patent Application No. 60/889,007, filed on Feb. 9, 2007 and entitled “Two-Stage Transcutaneous Insertion” (Attorney Docket No. 1062/E74).

### FIELD OF THE INVENTION

**[0007]** This application relates generally to adhesive and peripheral systems and methods for medical devices.

### BACKGROUND

**[0008]** Many potentially valuable medicines or compounds, including biologicals, are not orally active due to

poor absorption, hepatic metabolism or other pharmacokinetic factors. Additionally, some therapeutic compounds, although they can be orally absorbed, are sometimes required to be administered so often it is difficult for a patient to maintain the desired schedule. In these cases, parenteral delivery is often employed or could be employed.

**[0009]** Effective parenteral routes of drug delivery, as well as other fluids and compounds, such as subcutaneous injection, intramuscular injection, and intravenous (IV) administration include puncture of the skin with a needle or stylet. Insulin is an example of a therapeutic fluid that is self-injected by millions of diabetic patients. Users of parenterally delivered drugs would benefit from a wearable device that would automatically deliver needed drugs/compounds over a period of time.

**[0010]** To this end, there have been efforts to design portable devices for the controlled release of therapeutics. Such devices are known to have a reservoir such as a cartridge, syringe, or bag, and to be electronically controlled. These devices suffer from a number of drawbacks including the malfunction rate. Reducing the size, weight and cost of these devices is also an ongoing challenge.

### SUMMARY OF THE INVENTION

**[0011]** In one embodiment of the invention, a repeater system is provided for controlling a medical device. Such a system may include a repeater and a user interface. The repeater may include circuitry (i) for, over a given range, receiving signals from at least one wearable medical device, (ii) for, over the given range, transmitting signals to the wearable medical device, (iii) for, over a longer range exceeding the given range, transmitting the received signals to a user interface located remotely from the patient, and (iv) for, over the longer range, receiving signals from the user interface. The user interface may include circuitry (i) for receiving signals from the repeater, and (ii) for transmitting signals to the repeater. The medical devices may be wearable or implanted devices.

**[0012]** In some embodiments, the user interface’s circuitry may also provide for the reception of signals directly from the wearable device and the transmission of signals directly to the wearable device. Also, the repeater’s circuitry may be adapted to receive signals from multiple medical devices.

**[0013]** In some embodiments, the repeater may include one or more of the following: memory for logging received data, a processor for analyzing received data for the presence of a fault condition, and an alarm for notifying a user of the presence of a fault condition. The fault condition may include an occurrence of an event wherein the repeater is separated from the wearable medical device by more than the given range.

**[0014]** In one embodiment of the invention, a repeater is adapted to control a patch-sized pump worn on a subject for delivering fluid to the subject. In this embodiment, the repeater may have circuitry (i) for, over a given range, receiving signals from the pump, the received signals containing data relating to a volume of fluid delivered by the pump and relating to an alarm condition, and (ii) for, over a longer range exceeding the given range, transmitting the received signals to an interface for monitoring the volume of fluid delivered and the alarm condition. Such a repeater’s circuitry may also provide for, over the longer range, receiving control signals from the interface, the control signals
